

# Random Mode

A random colored print will automatically create splices for you in a non-specified order.

Written By: Mosaic Support

## INTRODUCTION

A random colored print will automatically create splices for you in a non-specified order. The result will be a print with random color changes with no transition tower required. Random colored prints are a great way to use up leftover spools or create neat effects on prints.

## Step 1 — Slice Your Model

- Slice a single-body STL model in CANVAS or your preferred slicer. Transfer the G-Code file to your printer.

## Step 2 — Select Random Mode

- Turn on Palette 2 and select Print Modes.
- Select Random, then tap Next.
- Select which inputs you would like to use, then tap Next.
- Specific if you'd like to use Random or Exact splice lengths.
- ⓘ Random will create splices of unequal length (between a min and max value) while Exact will create precise lengths. Either option will feed from selected inputs randomly.
- Enter the total print length by using a website like [gcode.ws](http://gcode.ws) to find the filament length of your print.
- ⓘ We suggest rounding this value up to ensure that you have enough filament to complete the print.

## Step 3 — Start Your Print

- Select the Start With Printer option.
- The Start Without Printer option will continuously create filament without waiting for an extruder to use the filament. This allows you to feed the spliced filaments onto a spool.
- Follow the on-screen instructions to load filament and begin the print.
- If you have any additional questions, please send us a message at [support@mosaicmfg.com](mailto:support@mosaicmfg.com).
